

Problem Statement: Deleting stale EBS snapshots in AWS.

Algorithm:

1. Start
2. Fetch all EBS snapshots owned by the current account('self').
3. Retrieve a list of active EC2 instances (both running and stopped).
4. For each snapshot in the fetched list:
 - a. Check if the snapshot has an associated volume.
 - b. If the snapshot has an associated volume:
 - (i) Check if the associated volume is associated with any active EC2 instance.
 - (ii) If not associated with any active instance:
- **Delete the stale snapshot.**
5. Repeat steps 4 for all snapshots fetched.
6. Stop
